Monitoring

The Internet of Things monitors the weather (Accurite), energy use (Efergy),

air quality (Airthings), and indoor temperatures (also Accurite). Each zone has either a Nest thermostat (4) or an Ecobee with a sensor in the back bedroom. These control the modulating boiler. One Nest is configured to control the ERV as a fan. The Amazon Alexa apps and the Echo can also control the thermostats and the Haiku fan in the master bedroom. Data is downloaded for analysis.
