

Tesla Solar Roof

We signed up for the Solar Roof in its first year of production, right after the announcement of withdrawal from the Paris Climate Accords. The Tesla design went through two upgrades before it was ready to be installed in Colorado. We were contacted almost a year before the actual installation and they put together a contract for 6 kW. We knew that was too small so we fixed the spa, then we were approved for 10 kW. But by the time the installation took place in late August 2021, we were upgraded to 16.02 kW due to a change in the law. That's better because our roof faces North.
